

Priority Scheduling	First Come First Served (FCFS)	Round Robin (RR)
Priority Scheduling is both preemptive and non-preemptive in nature.	FCFS is the non-preemptive scheduling algorithm.	RR is the preemptive scheduling algorithm
The average waiting time and average response time is unknown	Average waiting time is generally not minimal in First	Good Response time for a short process.
Priority Scheduling executes the processes according to the priority	The workload is processed in the order of arrival	The average waiting time for given set of processes is quite small and depends on the time quantum.
